

Week 8

Behavioural Research

- start with research hypotheses (must be clear)
- define dep and indep variables
- define null/alternative hypothesis

Experiment Components

Type I = false +ve
Type II = false -ve

α = prob of Type I. 0.05

β = prob of Type II.

power = $1 - \beta$

$\alpha \downarrow$ Type I $\downarrow$ Type II $\uparrow$

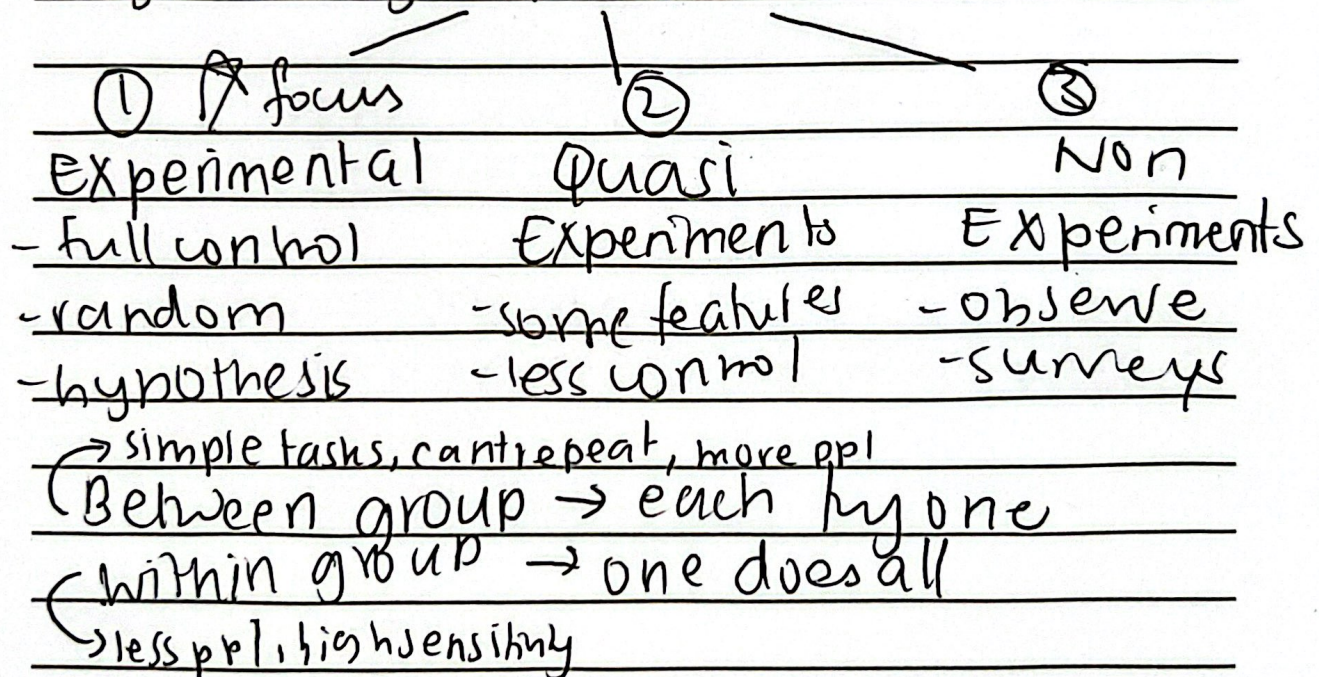

Trade off.

Type I is worse

Limitations

- ① needs to be well defined
- ② stricter control
- ③ not real world

Types of group studies

Factorial Design

- experiments divided by IV
- effect of device type depends on iron size
- interaction effect

Errors

①

random errors
larger sample

②

systematic
bias

- measurement
instruments

- procedures
