

Experimental setups

- ① ethnographic research
- ② participatory design
- ③ focus group
- ④ surveys
- ⑤ walkthroughs
- ⑥ open and closed card sorting
- ⑦ paper prototyping
- ⑧ usability testing

① Ethnographic Research

- We observe users in their environment
- We create personas

② Participatory design

- Users, designers, developers work together.
- Users on board

③ Focus group

- early stages
- group discussion to evaluate concepts not products

④ surveys

- initial stage, broad base

- gives quantitative + open ended

⑤ walkthroughs

- prototype stage
- users walkthrough the app

⑥ open closed card sorting

- how easy it is to find a function

⑦ open card

users pick and make categories

⑧ close card

we give categories

⑦ paper prototyping

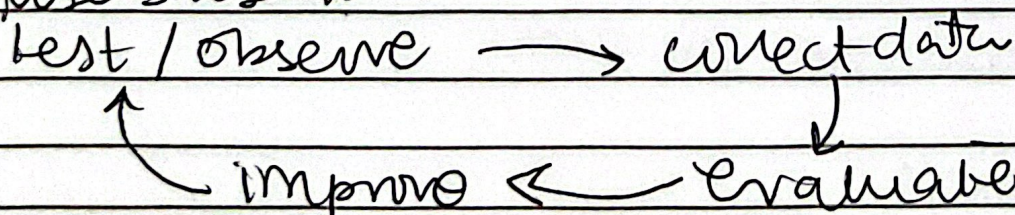

- paper versions of screens

⑧ expert heuristic evaluations

- experts review it

⑨ usability testing

- technique to get data while observing users use it

helps us understand people, eliminate bad design, improve.

Classic	usability
hypothesis	research qs / objectives
random	not random
groups	actual users
sample ↑	think aloud
	recommendations

Limitations

- ① may be artificial
- ② not fully representative
- ③ not always the best

Types of usability

- ① exploratory
- ② assessment
- ③ validation
- ④ comparison.

① EXPLORATORY - early

- effectiveness of the design
- how organized it is, findability
- communication

- many features

all visible
not functional

deep flow of
one workflow

② ASSESSMENT

- early / midway
- expand findings of low level operators
- less thinking aloud
- quantitative measures collected

③ VALIDATION

- late
- measure usability against established benchmarks
- confirm earlier points are fixed
- no moderator / think aloud

④ COMPARISON

- no fixed point
- compare two designs
- what makes it better
