

Class 3

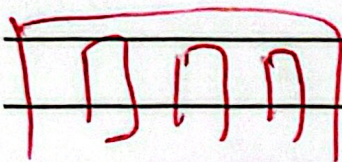

HUDSON
PHARMA

1-sep-2025

IDEO company

- ideo → they made a shopping cart but innovated it
- many people from diff backgrounds
- how do we solve our problems
- they made prototypes → physical form
- once it was there, people made comments on it

big
team

each team had
a specific thing
to cater to

small teams

at the end they
combined all

- communication, combination

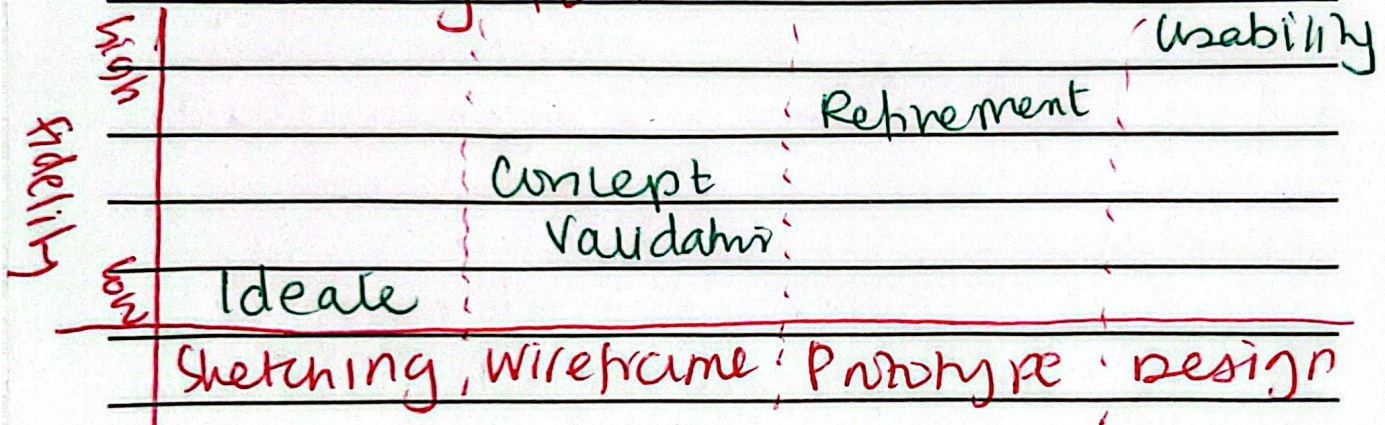

- ① proof of design
- ② user feedback
- ③ implementation

user interface prototyping

- how user interacts with screen
- UI elements
- how we move forward
- when we say we are designing it can be softwares (application, system, pipeline)

- It can also be hardware, interface
gani $\nwarrow \downarrow$
microwave

- This is also designing
- Steathoscope of doctors main chip
jagatkar CPT daaldiy, it's an
AI enabled Steathoscope, so now we
don't need doctors or doctors
listening to it

fidelity $\rightarrow$ Is it wired? cardboard?
(pencil? talk? app?)

$\rightarrow$ am I designing the whole screen
in it will be part of my system
afterwards?

- ex designing FBR etc so we
will always show high fidelity, it's
a multi billion dollar project
- so I must show a v. big design
- the implementation behind is later

- to first we sketch on paper pen
- rapid, free hand, big/small paper
- think of idea

Q. we have hostel / dayscholars

① MESS (food) is in hostel so they have to go back, and they stay hungry or until back to hostel.

- or if talent hunt, IBA gives 25000 he khaana kha

↳ student marzi to eat or spend elsewhere.

- we want to make it cash less and make IBA currency

- then use those coins for any IBA facility ex photocopy (0.01 for each page) (0.05 for coffee) etc

- 12 food areas at IBA.

- we can do this for all students, not just NTHP students

- so on IBA card

- on every area I need that machine

- so think of an idea

① fingerprint sensor (person verified)

- reader lagana Pareyga

② QR - but then person can be any one

- I will need to install scanners
- shaam ko as a vendor how will I get paid?
- (3) 1 cafe at a time
 - it's a start of the system
 - to see if it works
- (4) I need to set a rate
 - make a table of work
 - there are plans in the system
- (5) har student ki ERP
 - we use Nat ERP for a student system
 - need a coin management system
- (6) phone pe scanner
 - we implement on phone
 - not a scanner
 - rebo scan, just stand and scan, faster
- everyone is thinking in diff imp

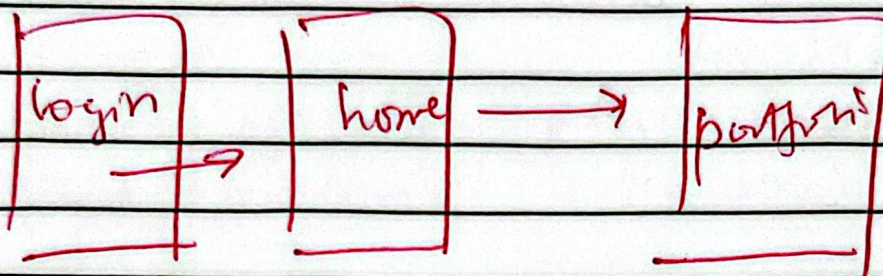

Security table etc.

↙ ↓ ↘
- har koi apni area mein baat kar raha hai
- these are ITERATIONS
- we
 - (1) ideate
 - (2) detailize
 - (3) visualize

- so we categorize everyone in an aspect and ask them for best in that
- now WIREFRAMES

basic visual guide

- tells me yahan via kya cheezain ayengi
- how the user interacts with it
- a little higher than sketching

- then PROTOTYPE

- more implemented to show how it works.
- if user agrees wireframe, then we go to prototype
- prototype is look and feel.

↓
skeleton of app

FIDELITY

- how much effort I'm putting in to make the prototype

suggestions are
applied

- If I just sketch $\rightarrow$ low (paper based)
- If I make a full system with dummy data, then it's high
↳ they can view and press
- depends on the
 - ① user design
 - ② content
 - ③ interactivity
- MIS is concept of fidelity

type of prototype

① throwaway prototype

- a builder says come to my office
- we see a model in their office
- gives look and feel, colors, but can't go and see the building
- after building done, you throw away the model
- ex mobiles are dummy in shops
- we see button, look / feel. but can't use

② incremental prototype

- builder says come to site and you see one house is ready out of 100 more to do

- you enter the home and see norms
- you say mera ghar wia hai he says 37, so you ask for modification
- we will do your changes
- the first ghar is not a dummy prototype, it's will be real and people will live
- this is incremental, it goes after part by part

③ evolutionary prototype

- you make, ask user client etc
- and you update
- you evolve model until final design.
- none of us know kha hai, karte jao using discussion

- the more you put an effort, the more you own, the more you protest for it

- so if you have a wireframe,
PUT  ARROWS TO SHOW WHAT
BUTTON LED TO IT

- does a user pick the group then text message or type  message then pick the group?

Storyboarding

- i want something that gives me full detail of the wireframe
- ex scene: actors, costumes, script
 - this is storyboarding

(1) interaction table where user can interact

(2) media table background music, image, video

- ex click OK and go to MD2 and make click sound - so detail
- so basically we make a storyboard

HIGH FIDELITY - as close to as a user experience

↓
collects true human performance data

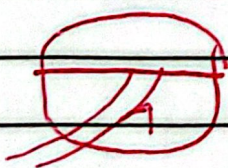

tools: Figma, Adobe, Sketch, Invision

- galileo AI, Wizard, Framer
- a diff tool cant solve other problems
- voice flow, bot mock
- augmented reality = adobe Aero, Shapes XR
- testing: maze, user testing

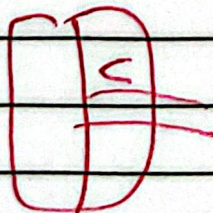

- hotjar, full story → how many people clicked what
- analytics ke on an AD what do people look at
- accessibility → screen plugin, axe devtools.
- people are moving towards AI tools
- so many ideas

affordance - user ko idea dena ke
kya kar sakta hai

- we kept a table at front row of audi
- they can keep their stuff
- It's not part of the audi furniture
- ex cars mein we always pull, not push

so we put our hand inside
handle — we can't push
it anymore

Vertical door handles
